

DATABASE DESIGN I - 1DL300

Assignment 2 - Database Design and ER Modeling

1 Database Design and ER Modeling

The overall purpose of the lab is to practice the process of modeling and designing a relational database given a specific scenario. The assignment involves extending a given entity-relationship (ER) diagram, and then translating the extended diagram to the relational model. The student should become familiar with how to create tables in SQL, define primary and foreign keys, and insert data into tables and update data in tables.

After the assignment, the student should be able to model real world scenarios in terms of enhanced entity-relationship (EER) models and to translate an EER diagram into a corresponding relational database implementation.

2 Preparation

If needed, install the Mimer system on your PC (not necessary if you run the assignment at the university) and then set up the Jonson Brothers database. Instructions for installing Mimer and scripts for loading the database can be found at the assignment course webpage.

- Elmasri and Navathe [EN10]: Chapter 4, 5 and 7.
- Padron-McCarthy and Risch [PMR05]: Chapter 2, 3, 7, and 9.

There is an supervised introduction to the assignment in your schedule.

3 Assignment

3.1 The scenario - a company database

The Jonson Brothers is a retail company with department stores in many major US cities. The company has a large number of employees and sells a varied line of products. To manage all information about the company structure and products, a database system is used. The company consists of a number of stores that contain a number of departments. The company has a number of employees, who (among other things) sell items at the different stores. Sales are registered in the sale and debit tables. The sale and debit tables may be a bit tricky to understand. You can view a row in the debit table as representing the complete receipt you get when you pay for your items, while a row in the sale table represents a row on such a receipt.

The company has contracts with various suppliers, who supply items for sale and also parts for the companys computer equipment. Deliveries of computer parts are registered in the supply table. The current state of the company database can be seen in the ER diagram given in Appendix A and the table definitions and contents in the Appendices B and C.

The business is expanding and the database is continuously being extended with new information. The management of Jonson Brothers has hired you to help them to extend their database. The work requires extensions to support a bonus system where managers can be given an extra bonus (e.g. if their departments have met their sale predictions) added to their salary. The management also wants to tie up customers to shop more by creating a credit card that users can use when paying for items that they buy.

3.2 Exercises

IMPORTANT NOTICE: Please be aware that Assignment 3 will be based on the results of these exercises. Putting effort into good solutions and to understand them is therefore highly recommended.

1. Start by analyzing the ER diagram in Appendix A, and the relational database in Appendices B and C. Based on the structure of the relational database denote on the diagram cardinality ratios of the relationships, such as one-to-one, one-to-many, and many-to-many. Also add participation constraints, such as partial or total participation.

2. Extend the ER diagram with an entity type **manager** that is a sub-class of employee. A manager is an employee who is head of a department, or manager of other employees, or both. Add support for a manager bonus that is added to the salary, by giving the manager entity a bonus attribute. Draw your extensions to the ER diagram in Appendix A, translate the extension to the relational model, and implement it in the company database.
3. Once you have changed the schema, change also the data, so that all managers are managers! That is, if you have made a manager table, you should insert data in it. Since manager data already exists in the database, it is desirable that you select it instead of entering it row by row. You also have to change the database implementation to ensure that only managers manage employees and departments.
4. All departments showed good sales figures last year! Give all current department managers 10000 in bonus. Note that not all managers are department managers.
5. In the existing database, your customers can buy things and pay for them, as reflected by the **sale** and **debit** tables. There is also support for membership cards (the **account** attribute). Now, you want to extend the membership card system, with possible credit. The customers will have accounts, where they can deposit and withdraw money, and pay for the purchases. Add the following:
 - Information about customers such as name, street address, city, and state must be stored. Notice that the database already contains some city information and avoid redundancies!
 - Information about accounts such as account number, balance, and allowed credit.
 - Information about account deposits and withdrawals such as transaction number, account number, amount, date, and the time of deposit or withdrawal, and the employee responsible for the transaction (that is, the employee that registers the transaction, not the customer that owns the account). Replace the entity type **debit** by a more general entity type, **transaction**. This entity type should represent not only sales transactions, but also deposits and withdrawals. You may want to drop the table **debit**, and create a new table **transaction** for this new information. Note that table **debit** contains data, which should not be lost. You will need aggregated functions to fill new “amount” column for the existing transactions.
 - Customers and accounts should be defined with customer and account numbers (integers) that can be automatically generated.

Extend the EER diagram with your new entities, relationships, and attributes. Implement your extensions into your database in Mimer. Ensure that all new relations are in BCNF. Add primary keys and any foreign keys to your table definitions.

Hints:

- Foreign keys are added either when defining a table (after the attribute definitions), or by altering it:

```
ALTER TABLE tablename1
ADD FOREIGN KEY (columnname1, columnname2, ...)
REFERENCES tablename2 (columnname1, columnname2, ...);
```

- Sequences are used to automatically generate unique numbers:

```
CREATE UNIQUE SEQUENCE seqname
INITIAL_VALUE = init_value INCREMENT = increment;
```

The generated sequence of numbers can be used as a default value for a column in a table definition:

```
DEFAULT NEXT_VALUE OF seqname
```

For further details, you are referred to the Mimer SQL Language Reference for details [M10]. Also, you can take a look in the script files that you loaded the original database from.

4 Examination

You should hand in an assignment report that include the following:

1. Your new EER diagram. You can extend and modify (possibly by hand) the ER diagram given in Appendix A.
2. SQL commands modifying the database schema and data: table definitions including primary and foreign key definitions, inserts, and updates. Include the replies from the database server when the commands are run;
3. Motivation why your relations are in BCNF by specifying all functional dependencies.

Note that you should hand in these solutions in one assignment report per group.

Appendix A: Entity-relationship diagram of the Jon-son Brothers company database

Appendix B: The DDL statements creating the Jonson Brothers company database schema

The schema for the existing company database is given below:

```
CREATE TABLE employee
(number INTEGER CONSTRAINT pk_employee PRIMARY KEY,
 name VARCHAR(20),
 salary INTEGER,
 manager INTEGER,
 birthyear INTEGER,
 startyear INTEGER);

CREATE TABLE dept
(number INTEGER CONSTRAINT pk_dept PRIMARY KEY,
 name VARCHAR(20),
 store INTEGER NOT NULL,
 floor INTEGER,
 manager INTEGER);

CREATE TABLE item
(number INTEGER CONSTRAINT pk_item PRIMARY KEY,
 name VARCHAR(20),
 price INTEGER,
 supplier INTEGER NOT NULL);

CREATE TABLE carries
(item INTEGER NOT NULL,
 dept INTEGER NOT NULL,
 qoh INTEGER CONSTRAINT ck_item_qoh CHECK (qoh >= 0),
 CONSTRAINT pk_carries PRIMARY KEY (item, dept));

CREATE TABLE parts
(number INTEGER CONSTRAINT pk_parts PRIMARY KEY,
 name VARCHAR(20),
 color VARCHAR(8),
 weight INTEGER,
 qoh INTEGER);

CREATE TABLE supply
(supplier INTEGER NOT NULL,
 part INTEGER NOT NULL,
 shipdate DATE NOT NULL,
 quan INTEGER,
 CONSTRAINT pk_supply PRIMARY KEY (supplier, part, shipdate));

CREATE TABLE sale
(debit INTEGER NOT NULL,
 item INTEGER NOT NULL,
 quantity INTEGER,
 CONSTRAINT pk_sale PRIMARY KEY (debit, item));

CREATE TABLE debit
(number INTEGER CONSTRAINT pk_debit PRIMARY KEY,
 sdate DATE DEFAULT CURRENT_DATE NOT NULL,
 employee INTEGER NOT NULL,
 account INTEGER);

CREATE TABLE city
(name VARCHAR(15) CONSTRAINT pk_city PRIMARY KEY,
```

```

state VARCHAR(6));

CREATE TABLE store
(number INTEGER CONSTRAINT pk_store PRIMARY KEY,
 city VARCHAR(15) NOT NULL);

CREATE TABLE supplier
(number INTEGER CONSTRAINT pk_supplier PRIMARY KEY,
 name VARCHAR(20),
 city VARCHAR(15) NOT NULL);

-- Add foreign keys

ALTER TABLE dept
ADD CONSTRAINT fk_dept_store FOREIGN KEY (store) REFERENCES store (number);

ALTER TABLE dept
ADD CONSTRAINT fk_dept_employee FOREIGN KEY (manager) REFERENCES employee (number)
ON DELETE SET NULL;

ALTER TABLE carries
ADD CONSTRAINT fk_carries_dept FOREIGN KEY (dept) REFERENCES dept (number);

ALTER TABLE item
ADD CONSTRAINT fk_item_supplier FOREIGN KEY (supplier) REFERENCES supplier (number);

ALTER TABLE supply
ADD CONSTRAINT fk_supply_supplier FOREIGN KEY (supplier) REFERENCES supplier (number);

ALTER TABLE supply
ADD CONSTRAINT fk_supply_parts FOREIGN KEY (part) REFERENCES parts (number);

ALTER TABLE sale
ADD CONSTRAINT fk_sale_item FOREIGN KEY (item) REFERENCES item (number);

ALTER TABLE sale
ADD CONSTRAINT fk_sale_debit FOREIGN KEY (debit) REFERENCES debit(number);
-- implies that a debit/transaction must be created before a sale record.

ALTER TABLE debit
ADD CONSTRAINT fk_debit_employee FOREIGN KEY (employee) REFERENCES employee(number);

ALTER TABLE store
ADD CONSTRAINT fk_store_city FOREIGN KEY (city) REFERENCES city (name);

ALTER TABLE supplier
ADD CONSTRAINT fk_supplier_city FOREIGN KEY (city) REFERENCES city (name);

-- Create the view that has to be modified in Assignment 3, question 17

CREATE VIEW sale_supply(supplier, item, quantity) as
SELECT supplier.name, item.name, sale.quantity
FROM supplier, item, sale
WHERE supplier.number = item.supplier AND
sale.item = item.number;

```

Appendix C: The contents of the existing company Jonson Brothers database

The tables of the existing company database are given below:
