Automata-Theoretic Approach [Vardi Wolper 1986]

- Question

?  
|=

- Construct  
Buchi Automaton

- Combine

- Find  
accepting computation (error trace)

# Translating formulas to Automata

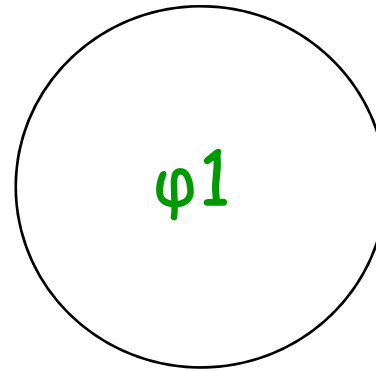

---

$\diamond(p \wedge \square \neg q)$

# Translating formulas to Automata

---

$\diamond(p \wedge \square \neg q)$

# Translating formulas to Automata

---

$\diamond(p \wedge \square \neg q)$

# Translating formulas to Automata

---

$\diamond(p \wedge \square \neg q)$

$\varphi \equiv p \wedge \circ\varphi1 \quad \vee \quad q \wedge \circ\varphi2$

# Decomposing temporal operators

---

## Pushing negations

$$\neg \square \varphi \equiv \diamond \neg \varphi$$

$$\neg \diamond \varphi \equiv \square \neg \varphi$$

$$\neg (\varphi \mathbf{U} \psi) \equiv \neg \psi \mathbf{W} (\neg \varphi \wedge \neg \psi)$$

$$\neg (\varphi \mathbf{W} \psi) \equiv \neg \psi \mathbf{U} (\neg \varphi \wedge \neg \psi)$$

## Putting on Normal form

$$\square \varphi \equiv \varphi \wedge \circ \square \varphi$$

$$\diamond \varphi \equiv \varphi \vee \circ \diamond \varphi$$

$$\varphi \mathbf{U} \psi \equiv \psi \vee (\varphi \wedge \circ \varphi \mathbf{U} \psi)$$

$$\varphi \mathbf{W} \psi \equiv \psi \vee (\varphi \wedge \circ \varphi \mathbf{W} \psi)$$

# Translating formulas to Automata

---

$$\psi \equiv \diamond(p \wedge \square \neg q)$$

# Translating formulas to Automata

---

$$\psi \equiv \diamond(p \wedge \square \neg q) \equiv (p \wedge \square \neg q) \vee \circ \diamond(p \wedge \square \neg q)$$

# Translating formulas to Automata

---

$$\begin{aligned}\psi &\equiv \diamond(p \wedge \square \neg q) \equiv (p \wedge \square \neg q) \vee \circ \diamond(p \wedge \square \neg q) \\ &\equiv (p \wedge \neg q \wedge \circ \square \neg q) \vee \circ \diamond(p \wedge \square \neg q)\end{aligned}$$

# Translating formulas to Automata

---

$$\begin{aligned}\psi &\equiv \diamond(p \wedge \square \neg q) \equiv (p \wedge \square \neg q) \vee \circ \diamond(p \wedge \square \neg q) \\ &\equiv (p \wedge \neg q \wedge \circ \square \neg q) \vee \circ \diamond(p \wedge \square \neg q)\end{aligned}$$

# Translating formulas to Automata

---

$$\begin{aligned}\psi &\equiv \diamond(p \wedge \square \neg q) \equiv (p \wedge \square \neg q) \vee \circ \diamond(p \wedge \square \neg q) \\ &\equiv (p \wedge \neg q \wedge \circ \square \neg q) \vee \circ \diamond(p \wedge \square \neg q)\end{aligned}$$

# Adding accepting states

---

$$\begin{aligned}\psi &\equiv \diamond(p \wedge \square \neg q) \equiv (p \wedge \square \neg q) \vee \circ \diamond(p \wedge \square \neg q) \\ &\equiv (p \wedge \neg q \wedge \circ \square \neg q) \vee \circ \diamond(p \wedge \square \neg q)\end{aligned}$$

# Searching for accepting computations

---

## Safety properties:

- $T \times A_{\neg\varphi}$  has self-loops on all accepting states
- Find a sequence of transitions from an initial state to a final states
- This is the **reachability problem**
- Can be solved by search from initial states
  - Visit all reachable states,
  - If accepting state is encountered, sequence of transitions = **error trace**

## Liveness properties:

- Infinite computation of  $T \times A_{\neg\varphi}$  must visit some accepting state infinitely many times
- Find a path to an accepting state, with a loop to itself
- This is the **repeated reachability problem**
- Can be solved by double search from initial states
  - Visit all reachable accepting states,
  - Search for loops from accepting states
  - If accepting loop ("lasso", "bad loop") is encountered = **error trace**

# General technique for finding loops

---

- Accepting runs == strongly connected components reachable from initial state
  - containing at least one accepting state
  - Having at least one internal transition
- Finding all SCCs of a graph can be done by Tarjan's algorithm (uses DFS)
- For finding some accepting cycle: more efficiently by nested depth-first search  
(Alur/Courcoubetis/Yannakakis, Holzmann)

# Searching for reachable accepting loops

[Alur Courcoubetis Dill]

---

1. Perform depth-first search of the reachable states
2. List reachable accepting states in **post-order**  
 $q_1, \dots, q_n$
3. Search from each  $q_i$  (starting with  $q_1$ ) to find a loop back to itself.
4. When post-order used, when searching states from  $q_j$ , one need not reconsider states that were reached from states  $q_i$  with  $i < j$

# Why post-order is good

---

Post-order is order of  
popping states in DFS

If  $q_1, \dots, q_n$  in post-order  
path from  $q_i$  to  $q_j$  with  
 $i < j$  must pass ancestor  
of  $q_i$

Hence if state reached  
from  $q_i$  has path to  $q_j$   
then  $q_i$  is in cycle

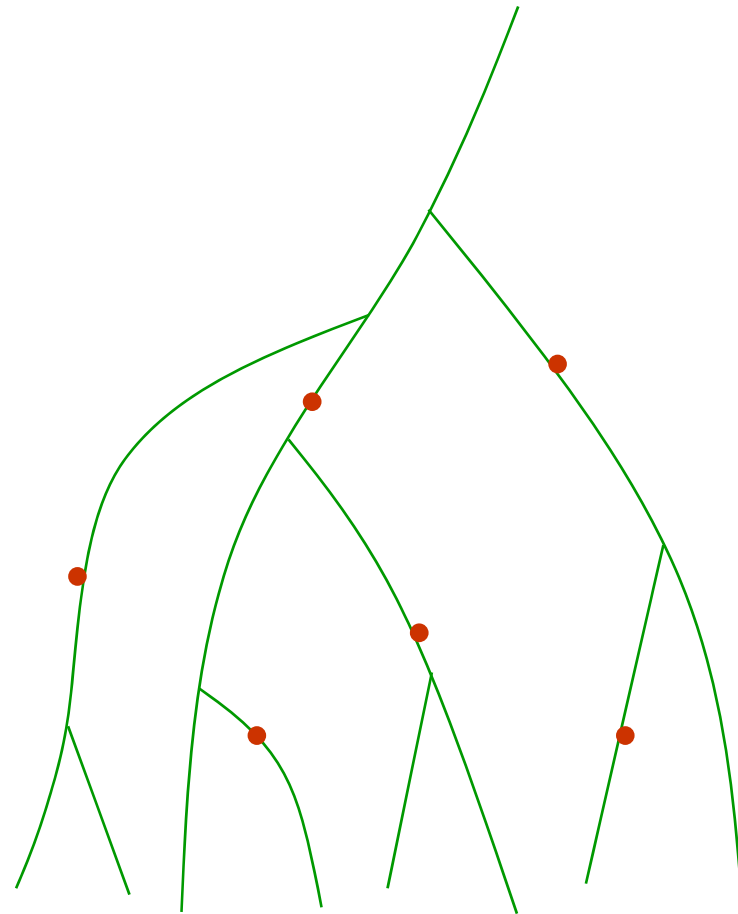

# Why post-order is good

---

Post-order is order of  
popping states in DFS

If  $q_1, \dots, q_n$  in post-order  
path from  $q_i$  to  $q_j$  with  
 $i < j$  must pass ancestor  
of  $q_i$

Hence if state reached  
from  $q_i$  has path to  $q_j$   
then  $q_i$  is in cycle

# Why post-order is good

---

Post-order is order of  
popping states in DFS

If  $q_1, \dots, q_n$  in post-order  
path from  $q_i$  to  $q_j$  with  
 $i < j$  must pass ancestor  
of  $q_i$

Hence if state reached  
from  $q_i$  has path to  $q_j$   
then  $q_i$  is in cycle

# Pseudocode f. Nested Depth-First Search

---

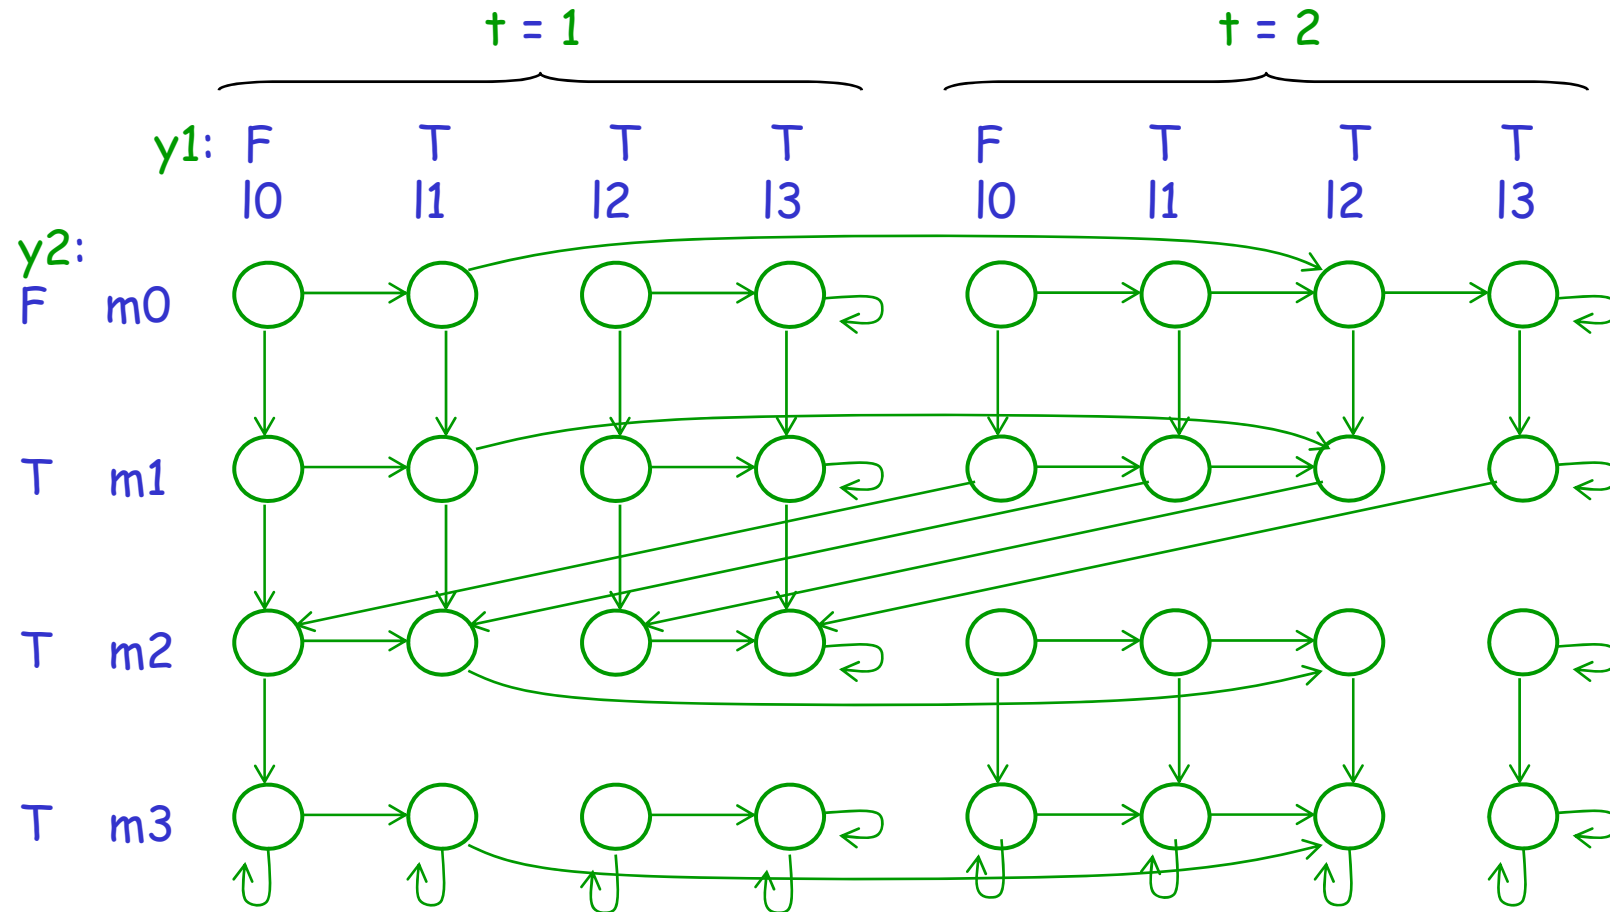

Procedure **DFS1(s)**:

```
Stack.push(s); Visited.insert(s);  
∀ successors s' of s do  
    if s' not in Visited then DFS1(s');  
if accepting (s) then DFS2(s);  
Stack.pop();
```

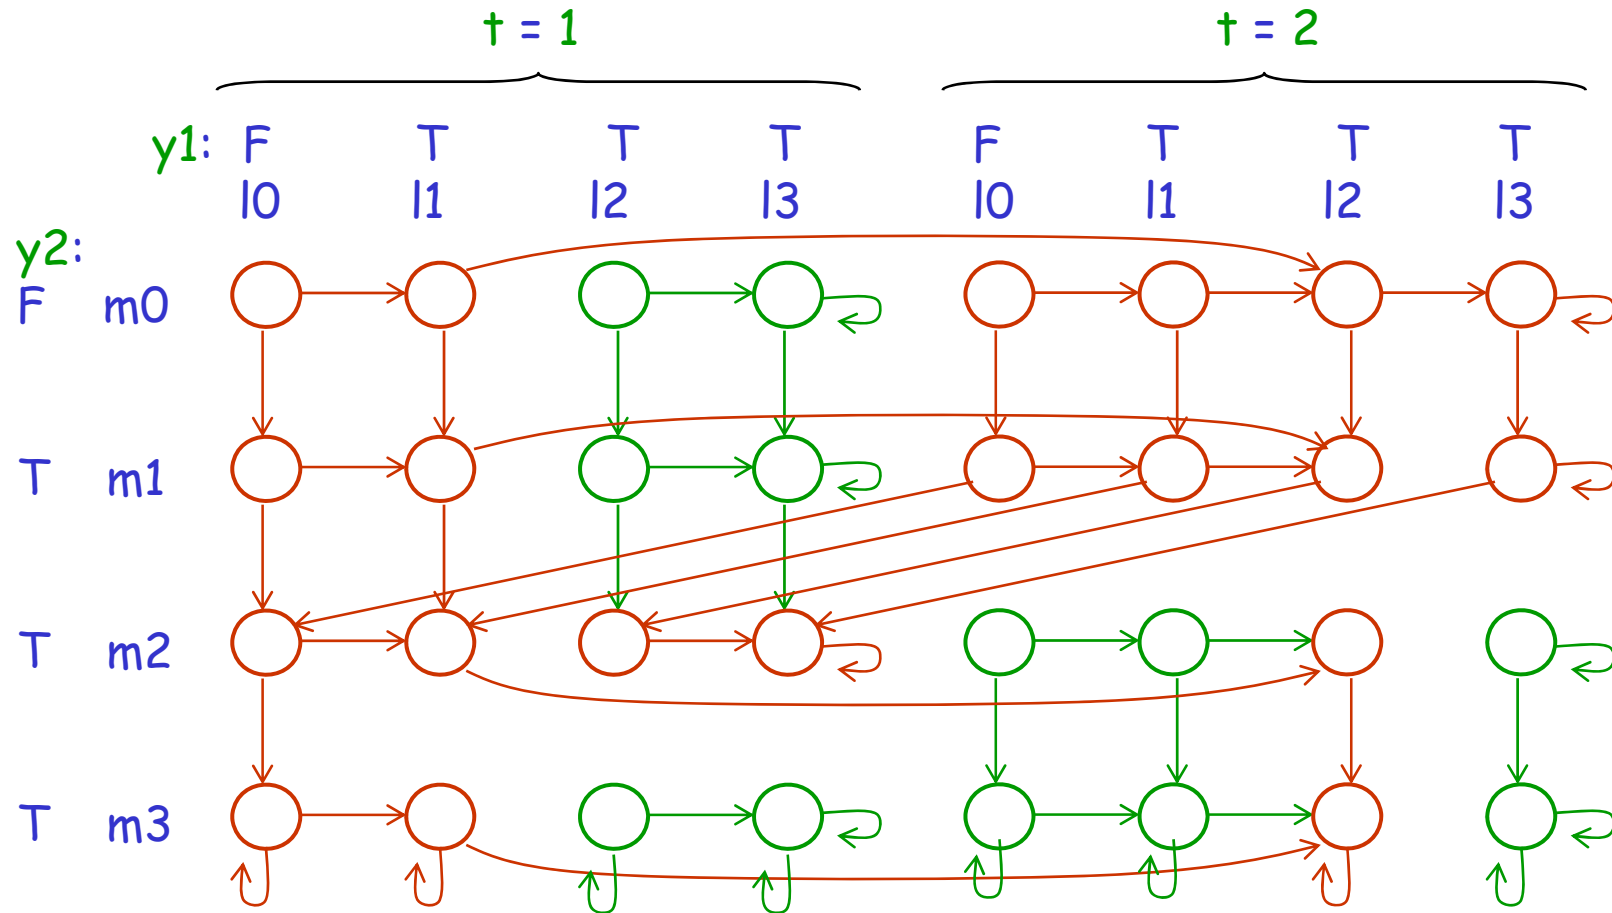

Procedure **DFS2(s)**:

```
flagged(s) <- true;  
∀ successors s' of s do  
    if s' in Stack then return "exists cycle"  
    if not flagged(s') then DFS2(s');
```

# State-space exploration of PF

# Reachable states

# DFS tree

# DFS tree with automaton

The graph has no loops that do not visit  $l_3$

# Add self-loops at $l_0$ and $m_0$

The graph has no loops that do not visit  $l_3$

# Add self-loops at $l_0$ and $m_0$

The graph has a bad loop that does not visit  $l_3$

# Add self-loops at $l_0$ and $m_0$

This is the first to be visited

# Peterson-Fischer: Possible Specifications

Variables:  $y1, y2$ : boolean,  $t$ :  $\{1,2\}$   
 Initially  $y1 = y2 = \text{false}, t = 1$

Mutual Exclusion:  $\square \neg(\text{at } l3 \wedge \text{at } m3)$

Absence of Starvation:  $\square (\text{at } l1 \rightarrow \diamond \text{at } l3)$

Bounded Overtaking:  $\square (\text{at } l1 \rightarrow (\neg \text{at } m3 \cup (\text{at } m3 \cup (\neg \text{at } m3 \cup \text{at } l3))))$

# Simpler mutex

Variables:  $\dagger: \{1,2\}$

Initially  $\dagger = 1$

Mutual Exclusion:  $\square \neg(\text{at } l2 \wedge \text{at } m3)$

Absence of Starvation:  $\square (\text{at } l2 \rightarrow \blacklozenge \text{at } l3)$

Bounded Overtaking:  $\square (\text{at } l2 \rightarrow (\neg \text{at } m3 \cup (\text{at } m3 \cup (\neg \text{at } m3 \cup \text{at } l3))))$

# No loops can be found

---

# Simpler mutex with self-loops

Variables:  $\dagger: \{1,2\}$

Initially  $\dagger = 1$

Mutual Exclusion:  $\square \neg(\text{at } l2 \wedge \text{at } m3)$

Absence of Starvation:  $\square (\text{at } l2 \rightarrow \blacklozenge \text{at } l3)$

Bounded Overtaking:  $\square (\text{at } l2 \rightarrow (\neg \text{at } m3 \cup (\text{at } m3 \cup (\neg \text{at } m3 \cup \text{at } l3))))$

# State space with self-loops

---

# Idle loop found

---

# Corresponding bad reachable loop

---

# Peterson-Fischer with idle loops

Variables:  $y1, y2$ : boolean,  $t$ :  $\{1,2\}$

Initially  $y1 = y2 = \text{false}, t = 1$

We need mechanism to avoid computations that only perform idle steps

Fairness

# Fairness

---

- Assumption that some part of a transition system eventually progresses, without quantitative restrictions
- Can be viewed as an abstraction of many possible concrete transition scheduling policies.
- There are many different notions of fairness.
- The most common is **weak fairness**
- Another not uncommon is **strong fairness**

# Fairness (definition)

---

- **action  $A$**  : any set of transitions (e.g., of one process)

- A computation

$s_0 \quad s_1 \quad s_2 \quad s_3 \quad s_4 \quad s_5 \quad s_6 \quad s_7 \quad . . .$

is

- **weakly fair wrp. to  $A$**  if
  - whenever  $A$  is enabled in **all  $s_j$**  with  $j > i$   
then some transition  $A$  is taken from some  $s_k$  with  $k > i$
  - $\square(\square \text{ enabled } A \rightarrow \diamond \text{ taken } A)$
  - $\diamond \square \text{ enabled } A \rightarrow \square \diamond \text{ taken } A$
- **strongly fair wrp. to  $A$**  if
  - whenever  $A$  is enabled in **infinitely many  $s_j$**  with  $j > i$   
then some transition  $A$  is taken from some  $s_k$  with  $k > i$
  - $\square(\square \diamond \text{ enabled } A \rightarrow \diamond \text{ taken } A)$
  - $\square \diamond \text{ enabled } A \rightarrow \square \diamond \text{ taken } A$

# Fairness (definition)

---

- **action  $A$**  : any set of transitions (e.g., of one process)

- A computation

$s_0 \quad s_1 \quad s_2 \quad s_3 \quad s_4 \quad s_5 \quad s_6 \quad s_7 \quad . \quad . \quad .$

is

- **Weakly fair wrp. to  $A$**  if
  - whenever  $A$  is enabled in **all**  $s_j$  with  $j > i$
  - then some transition  $A$  is taken from some  $s_k$  with  $k > i$
  - $\square(\square \text{ enabled } A \rightarrow \diamond \text{ taken } A)$
  - $\diamond \square \text{ enabled } A \rightarrow \square \diamond \text{ taken } A$
- **Strongly fair wrp. to  $A$**  if
  - whenever  $A$  is enabled in **infinitely many**  $s_j$  with  $j > i$
  - then some transition  $A$  is taken from some  $s_k$  with  $k > i$
  - $\square(\square \diamond \text{ enabled } A \rightarrow \diamond \text{ taken } A)$
  - $\square \diamond \text{ enabled } A \rightarrow \square \diamond \text{ taken } A$

# Checking fairness in exploration algorithm

---

To verify  $\varphi$  under fairness assumption

- Naive algorithm searches for bad loops that satisfy  
fairness assumption  $\wedge \neg \varphi$

More efficient solution for weak fairness:

- search for bad loops that satisfy  $\neg \varphi$   
in which each action  $A$  with weak fairness is once  
either disabled or taken

# Add self-loops at $l_0$ and $m_0$

The loop does not have left process disabled or taken
