## 1. Matrix Models

Example: Sport schedule in Periods $\times$ Weeks $\rightarrow$ Teams $\times$ Teams
for:

- $\mid$ Teams $\mid=n$
- $\mid$ Weeks $\mid=n-1$
- $\mid$ Periods $\mid=n / 2$
such that:
- every team plays every other team once;
- every team plays exactly once per week;
- every team plays at most twice per period.

A solution for $n=8$ :

| Period 1 | Week | Week 2 | Week 3 | Week 4 | Week 5 | Week 6 | Week 7 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 vs 1 | 0 vs 2 | 1 vs 5 | 2 vs 4 | 3 vs 6 | 3 vs 7 | 4 vs 7 |
| Period 2 | 2 vs 3 | 1 vs 7 | 0 vs 6 | 5 vs 6 | 5 vs 7 | 1 vs 4 | 0 vs 3 |
| Period 3 | 4 vs 5 | 3 vs 5 | 2 vs 7 | 0 vs 7 | 0 vs 4 | 2 vs 6 | 1 vs 6 |
| Period 4 | 6 vs 7 | 4 vs 6 | 3 vs 4 | 1 vs 3 | 1 vs 2 | 0 vs 5 | 2 vs 5 |

## 2. Symmetries (in Matrix Models)

|  | Week 1 |  | Week 2 | Week 3 | Week 4 | Week 5 | Week 6 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | Week 7

The periods, weeks, and teams are indistinguishable, because:
(1) the periods (rows) can be permuted (variable symmetry);
(2) the weeks (columns) can be permuted (variable symmetry);
(3) the teams of any game can be permuted (variable symmetry);
(4) the teams can be permuted (value symmetry);
without affecting the solution status of any assignment.
Definition: A symmetry class (or orbit, in group theory) is an equivalence class of assignments under all the symmetries (including their compositions).

## 3. Symmetry-Breaking Before Search

Add (lexicographic) ordering constraints so that (ideally) each orbit has exactly one element:
(1) every row is lexicographically smaller than or equal to (denoted $\leq_{l e x}$ ) the next, if any;
(2) every column is lexicographically smaller than or equal to the next, if any;
(3) the first team of every game has a smaller number than the second team of the game.

When lexicographically ordering along every dimension with indistinguishable indices:

- No orbit is of size 0 .
- However, in general, not all orbits are of size 1, except if all the matrix values are distinct, etc.

Counterexample: symmetric matrices with lexicographically ordered rows and columns:

$$
\left[\begin{array}{lll}
0 & 0 & 1 \\
0 & 1 & 1 \\
1 & 0 & 0
\end{array}\right] \leftarrow \begin{gathered}
\text { swap rows } 2
\end{gathered} \text { \& } 3 .\left[\begin{array}{lll}
\text { swap columns } 1 & \& & 0
\end{array}\right) \rightarrow\left[\begin{array}{lll}
0 & 1 & 0 \\
1 & 0 & 1
\end{array}\right] \leftarrow \begin{array}{|}
\text { swap rows } 1 & \& & 2 \\
\text { swap columns } 2 & \& & 3
\end{array} \rightarrow\left[\begin{array}{lll}
0 & 0 & 1 \\
0 & 1 & 0 \\
1 & 1 & 0
\end{array}\right]
$$

## 4. The Crawford et al. Method for Breaking All the Symmetries

Consider a matrix with total row and column symmetry: $\left[\begin{array}{lll}x_{1} & x_{2} & x_{3} \\ x_{4} & x_{5} & x_{6}\end{array}\right]$ Group Sym of 12 symmetries (permutations):

| Permutation | Name | Order |
| :---: | :---: | :---: |
| $(1,2)(4,5)$ | $P_{c 12}$ | 2 |
| $(2,3)(5,6)$ | $P_{c 23}$ | 2 |
| $(1,4)(2,5)(3,6)$ | $P_{r 12}$ | 2 |
| () | id | 1 |
| $(1,6,2,4,3,5)$ | $P_{\delta}$ | 6 |
| $(1,5,3,4,2,6)$ | $P_{\sigma}$ | 6 |
| $(1,4)(2,6)(3,5)$ | $P_{\alpha 1}$ | 2 |
| $(1,5)(2,4)(3,6)$ | $P_{\alpha 2}$ | 2 |
| $(1,6)(2,5)(3,4)$ | $P_{\alpha 3}$ | 2 |
| $(1,3)(4,6)$ | $P_{c 13}$ | 2 |
| $(1,2,3)(4,5,6)$ | $P_{c 123}$ | 3 |
| $(1,3,2)(4,6,5)$ | $P_{c 132}$ | 3 |

Cycle notation: $(1,2,3)(4,5)$ denotes the function $\left\{x_{1} \rightarrow x_{2}, x_{2} \rightarrow x_{3}, x_{3} \rightarrow x_{1}, x_{4} \rightarrow x_{5}, x_{5} \rightarrow x_{4}, x_{6} \rightarrow x_{6}\right\}$.

## Illustration

## Induced Symmetry-Breaking Constraints (SBCs)

(1) Pick a variable ordering $m$ of the matrix.
(2) Add the constraint $m \leq_{l e x} \sigma(m)$ for each $\sigma \in S y m \backslash\{i d\}$.

Example: Take $m=\left[\begin{array}{lll}x_{1} & x_{2} & x_{3} \\ x_{4} & x_{5} & x_{6}\end{array}\right]$
$(1,2)(4,5)$
$(2,3)(5,6)$
$(1,4)(2,5)(3,6)$
(1,6,2,4,3,5)
(1,5,3,4,2,6)
$(1,4)(2,6)(3,5)$
$(1,5)(2,4)(3,6)$
$(1,6)(2,5)(3,4)$
$(1,3)(4,6)$
$(1,2,3)(4,5,6)$
$(1,3,2)(4,6,5)$

| $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ | $x_{6}$ | $\begin{aligned} & \leq_{l e x} \\ & \leq_{l o x} \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ | $x_{6}$ |  |
| $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ | $x_{6}$ |  |
| $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ | $x_{6}$ |  |
| $x_{1}$ | $x_{2}$ | $x_{3}$ | $x$ | $x_{5}$ | $x_{6}$ |  |
| $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ | $x_{6}$ |  |
| $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ | $x_{6}$ |  |
| $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ | $x_{6}$ |  |
| $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ | $x_{6}$ |  |
| $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ | $x_{6}$ |  |
| $\chi_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ | $x_{5}$ | $x_{6}$ | $\leq 1$ |

| $x_{2}$ | $x_{1}$ | $x_{3}$ | $x_{5}$ | $x_{4}$ | $x_{6}$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $x_{1}$ | $x_{3}$ | $x_{2}$ | $x_{4}$ | $x_{6}$ | $x_{5}$ |
| $x_{4}$ | $x_{5}$ | $x_{6}$ | $x_{1}$ | $x_{2}$ | $x_{3}$ |
| $x_{6}$ | $x_{4}$ | $x_{5}$ | $x_{3}$ | $x_{1}$ | $x_{2}$ |
| $x_{5}$ | $x_{6}$ | $x_{4}$ | $x_{2}$ | $x_{3}$ | $x_{1}$ |
| $x_{4}$ | $x_{6}$ | $x_{5}$ | $x_{1}$ | $x_{3}$ | $x_{2}$ |
| $x_{5}$ | $x_{4}$ | $x_{6}$ | $x_{2}$ | $x_{1}$ | $x_{3}$ |
| $x_{6}$ | $x_{5}$ | $x_{4}$ | $x_{3}$ | $x_{2}$ | $x_{1}$ |
| $x_{3}$ | $x_{2}$ | $x_{1}$ | $x_{6}$ | $x_{5}$ | $x_{4}$ |
| $x_{2}$ | $x_{3}$ | $x_{1}$ | $x_{5}$ | $x_{6}$ | $x_{4}$ |
| $x_{3}$ | $x_{1}$ | $x_{2}$ | $x_{6}$ | $x_{4}$ | $x_{5}$ |

## 5. Improvements, Conjectures, and Directions

## Internal Simplifications

Example: $(1,3)(4,6)=(1,3)(2)(4,6)(5)$ induces $\left[x_{1}, x_{2}, x_{3}, x_{4}, x_{5}, x_{6}\right] \leq_{\text {lex }}\left[x_{3}, x_{2}, x_{1}, x_{6}, x_{5}, x_{4}\right]$

$$
\begin{aligned}
& \equiv\left(x_{1} \leq x_{3}\right) \wedge\left(x_{1}=x_{3} \rightarrow x_{2} \leq x_{2}\right) \wedge\left(x_{1}=x_{3} \wedge x_{2}=x_{2} \rightarrow x_{3} \leq x_{1}\right) \wedge\left(x_{1}=x_{3} \wedge x_{2}=x_{2} \wedge x_{3}=x_{1} \rightarrow x_{4} \leq x_{6}\right) \wedge \ldots \\
& \equiv\left(x_{1} \leq x_{3}\right) \wedge\left(x_{1}=x_{3} \rightarrow x_{4} \leq x_{6}\right) \wedge \ldots \\
& \equiv\left[x_{1}, x_{4}\right] \leq_{\text {lex }}\left[x_{3}, x_{6}\right]
\end{aligned}
$$

The elements at the positions corresponding to the last indices in each cycle can be deleted!
$(1,2)(4,5)$
$(2,3)(5,6)$
$(1,4)(2,5)(3,6)$
$(1,6,2,4,3,5)$
$(1,5,3,4,2,6)$
$(1,4)(2,6)(3,5)$
$(1,5)(2,4)(3,6)$
$(1,6)(2,5)(3,4)$
$(1,3)(4,6)$
$(1,2,3)(4,5,6)$
$(1,3,2)(4,6,5)$

$\left(c_{23}\right)$
$\left(r_{12}\right)$
$(\delta)$
$(\sigma)$
$\left(\alpha_{1}\right)$
$\left(\alpha_{2}\right)$
$\left(\alpha_{3}\right)$
$\left(c_{13}\right)$
$\left(c_{123}\right)$
$\left(c_{132}\right)$

## Elimination of Logically Implied SBCs

The first two SBCs
$(1,2)(4,5)$
$(2,3)(5,6)$

| $x_{1}$ |  |  | $x_{4}$ |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  | $x_{2}$ |  |  | $x_{5}$ |  |

| $\leq_{l e x}$ | $x_{2}$ |  |  | $x_{5}$ |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\leq_{l e x}$ |  | $x_{3}$ |  |  | $x_{6}$ |  |

$$
\begin{aligned}
& \left(c_{12}\right) \\
& \left(c_{23}\right)
\end{aligned}
$$

logically imply the last three SBCs

$$
\begin{aligned}
& (1,3)(4,6) \\
& (1,2,3)(4,5,6) \\
& (1,3,2)(4,6,5)
\end{aligned}
$$

| $x_{1}$ |  |  | $x_{4}$ |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $x_{1}$ | $x_{2}$ |  | $x_{4}$ | $x_{5}$ |  |
| $x_{1}$ | $x_{2}$ |  | $x_{4}$ | $x_{5}$ |  |

| $\leq_{\text {lex }}$ | $x_{3}$ |  |  | $x_{6}$ |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\leq_{\text {lex }}$ | $x_{2}$ | $x_{3}$ |  | $x_{5}$ | $x_{6}$ |  |
| $\leq_{\text {lex }}$ | $x_{3}$ | $x_{1}$ |  | $x_{6}$ | $x_{4}$ |  |
|  |  |  |  |  |  |  |

which can thus be eliminated:

- The last three SBCs rule out some permutations of the three columns.
- But $c_{12} \wedge c_{23}$ imposes a particular permutation and also rules out those other permutations.

In general:

- An $m \times n$ matrix with total row and column symmetry has $m!\cdot n!$ symmetries.
- There are (at least) $m!-m+n!-n$ logically implied SBCs, due to the transitivity of $\leq_{l e x}$ !
- Direction: Try the redundancy detection criteria of ILP, especially [Imbert \& Van Hentenryck].

Contextual Simplifications in $\delta$ and $\sigma$ (due to Frisch and Harvey)
$(1,2)(4,5)$
$(2,3)(5,6)$
$(1,4)(2,5)(3,6)$
$(1,6,2,4,3,5)$
$(1,5,3,4,2,6)$
$(1,4)(2,6)(3,5)$
$(1,5)(2,4)(3,6)$
$(1,6)(2,5)(3,4)$

| $x_{1}$ |  |  | $x_{4}$ |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  | $x_{2}$ |  |  | $x_{5}$ |  |
| $x_{1}$ | $x_{2}$ | $x_{3}$ |  |  |  |
| $x_{1}$ | $x_{2}$ | $x_{3}$ |  |  |  |
| $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ |  |  |
| $x_{1}$ | $x_{2}$ | $x_{3}$ |  |  |  |
| $x_{1}$ | $x_{2}$ | $x_{3}$ |  |  |  |
| $x_{1}$ | $x_{2}$ | $x_{3}$ |  |  |  |

| $\leq_{l e x}$ | $x_{2}$ |  |  | $x_{5}$ |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\leq_{l e x}$ |  | $x_{3}$ |  |  | $x_{6}$ |  |
| $\leq_{l e x}$ | $x_{4}$ | $x_{5}$ | $x_{6}$ |  |  |  |
| $\leq_{l e x}$ | $x_{6}$ | $x_{4}$ | $x_{5}$ |  |  |  |
| $\leq_{l e x}$ | $x_{5}$ | $x_{6}$ | $x_{4}$ | $x_{2}$ |  |  |
| $\leq_{l e x}$ | $x_{4}$ | $x_{6}$ | $x_{5}$ |  |  |  |
| $\leq_{l e x}$ | $x_{5}$ | $x_{4}$ | $x_{6}$ |  |  |  |
| $\leq_{l e x}$ | $x_{6}$ | $x_{5}$ | $x_{4}$ |  |  |  |
|  |  |  |  |  |  |  |

$\left(c_{12}\right)$ ( $c_{23}$ )
$\left(\alpha_{3}\right)$

Direction: How to mechanise these contextual internal simplifications?

## Experimental Results

- Encouraging results even when only using $c_{12}, c_{23}$, and $r_{12}$ as SBCs, due to the action of the actual problem constraints.
- Nevertheless: When does a polynomial number of SBCs suffice to break all / most symmetries?!

## Elimination of Domain-Dependent Implied SBCs

The number of implied SBCs grows as the domain size of the decision variables shrinks!

| Domain size |  | $c_{12}$ | $c_{23}$ | $r_{12}$ | $\delta$ | $\sigma$ | $\alpha_{1}$ | $\alpha_{2}$ | $\alpha_{3}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | Implied SBCs |  |  |  | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | Minimum set | $\boldsymbol{X}$ | $\boldsymbol{X}$ | $\boldsymbol{X}$ | $\boldsymbol{X}$ |  |  |  |  |
|  | Minimum set | $\boldsymbol{X}$ | $\boldsymbol{X}$ | $\boldsymbol{X}$ |  |  | $\boldsymbol{X}$ |  |  |
| 3 | Implied SBCs |  |  |  | $\checkmark$ |  | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | Minimum set | $\boldsymbol{X}$ | $\boldsymbol{X}$ | $\boldsymbol{X}$ | $\boldsymbol{X}$ | $\boldsymbol{X}$ |  |  |  |
| $\geq 4$ | Implied SBCs |  |  |  |  |  |  |  |  |
|  | Minimum set | $\boldsymbol{X}$ | $\boldsymbol{X}$ | $\boldsymbol{X}$ | $\boldsymbol{X}$ | $\boldsymbol{X}$ | $\boldsymbol{X}$ | $\boldsymbol{X}$ | $\boldsymbol{X}$ |

Conjecture: For a domain of size 2, it suffices to add the SBCs induced by the order 2 permutations.
Experimentally validated up to $6 \times 6$ matrices.
Not true for domains of size 3: the constraint $\sigma$ is necessary, but its permutation is of order 6 .
Unfortunately, even the number of order 2 permutations is super-polynomial...
Direction: Will elimination of the implied order 2 SBCs leave a polynomial number of SBCs?
Direction: How to characterise the SBCs necessary for each domain size?
Direction: How to characterise the SBCs that break most of the symmetries?

## 6. Experimental Results

Enumerating all the $3 \times 3$ matrices modulo total row and column symmetry, in the absence of any actual problem constraints:

- 35 SBCs;
- 6 implied SBCs, by transitivity of $\leq_{\text {lex }}$;
- 9 further implied SBCs, for domain sizes from 4 to at least 6 , which can all be eliminated.

Run-times in seconds, under GNU Prolog, on a Sun SPARC Ultra station 10:

|  |  | with all the 35 constraints | without 15 implied constraints |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | before internal simplifications | after internal simplifications |
| domain size $=4$ | Boolean $\leq_{\text {lex }}$ |  | 11.0" | 5.8" | 2.1" |
| (8,240 matrices) | linear $\leq_{l e x}$ | 8.3" | $4.5 "$ | 1.6" |
| domain size $=5$ | Boolean $\leq_{l e x}$ | 61.0" | 31.8" | 12.4" |
| (57,675 matrices) | linear $\leq_{l e x}$ | 49.6" | 26.7 " | 10.0" |
| domain size $=6$ | Boolean $\leq_{\text {lex }}$ | 269.0" | 139.0" | 56.1" |
| (289,716 matrices) | linear $\leq_{l e x}$ | 227.0" | 122.6" | 46.5" |
