# Representations and descriptors

Next step after segmentation is to represent the object in a good way that makes it possible to describe it.

- Two ways to represent regions:
  - **Boundary** (external characteristics)
    - Shape, orientation
  - **Whole region** (internal characteristics)
    - Color, texture, histogram

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

# Scale, rotation and translation

- Most of the time we are interested to choose descriptors that are invariant of variations of scale, rotation and translation whenever possible

But not always in Optical character recognition (OCR) Rotation and scale is important like **P** and **d**

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

# Chain Coding

## Boundary representation

- Walk around the object boundary and describe directional change in each step by a number

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

# Chain Coding

## Considerations

- Code become very long and noise sensitive
  - Use larger grid spacing, 0710 = 00
- Scale dependent
  - Choose appropriate grid spacing
- Start point determines result
  - Treat code as circular (minimum magnitude integer)  
754310 → 075431
- Depends on rotation
  - Calculate difference code (counterclockwise)  
075431 → 767767

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

# Polygonal Approximations

## Boundary representation

- A digital boundary can be approximated (simplified)
- For closed boundaries:
  - Approximation becomes exact when no. of segments of the polygons is equal to the no. of points in the boundary
- Goal is to capture the essence of the object shape
- Approximation can become a time consuming iterative process

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

SLU

# Polygonal Approximations

- **Minimum Perimeter Polygons (MPPs)**
  - Cover the boundary with cells of a chosen size and force a rubber band like structure to fit inside the cells

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

SLU

# Polygonal Approximations

- Merging techniques

1. Walk around the boundary and fit a least-square-error line to the points until an error threshold is exceeded
2. Start a new line, go to 1
3. When start point is reached the intersections of adjacent lines are the vertices of the polygon

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

# Polygonal Approximations

- Splitting techniques
  1. Start with an initial guess, e.g., based on majority axes
  2. Calculate the orthogonal distance from lines to all points
  3. If maximum distance  $>$  threshold, create new vertex there
  4. Repeat until no points exceed criterion

# Signatures

Boundary representation

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

# Signatures

## Boundary representation

- A 1D representation of a boundary
- Could be implemented in different ways
  - Distance from centre point to border as a function of angle
  - Angle between the tangent in each point and a reference line (slope density function)
- Independent of translation, but not rotation & scaling.

### Possible solutions:

- Select unique starting point (e.g. based on major axis)
- Normalize amplitude of signature (divide by variance)

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

SLU

# Boundary segments

## Boundary representation

- When a boundary contains major concavities that carry shape information it can be worthwhile to decompose it into segments
- A good way to achieve this is to calculate the convex Hull of the region enclosed by the boundary
- Can be a bit noise sensitive
  - Smooth prior to Convex hull calculation
  - Calculate Convex Hull on polygon approximation

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

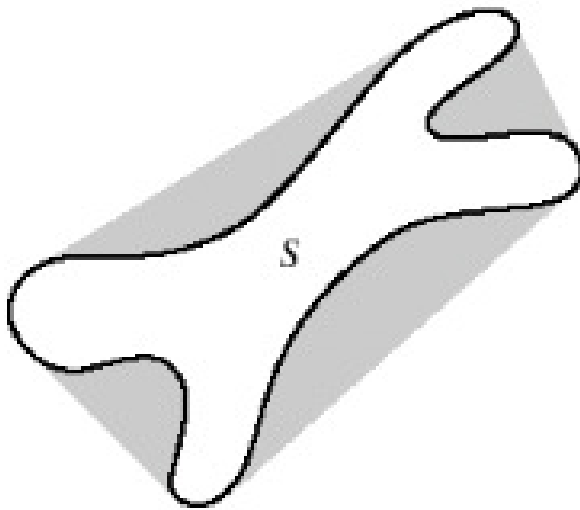

UPPSALA  
UNIVERSITET

SLU

# Boundary segments

- Can be a bit noise sensitive
  - Smooth prior to Convex Hull calculation
  - Calculate Convex Hull on polygonal approximation

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

# Skeletons

## Shape representation

- Skeletons could be used as curve representations of an object
- Should in general be thin, centered, topologically equivalent to original object and reversible

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

SLU

# Skeletons

- Example:

Swedish University of Agricultural Sciences  
Uppsala University

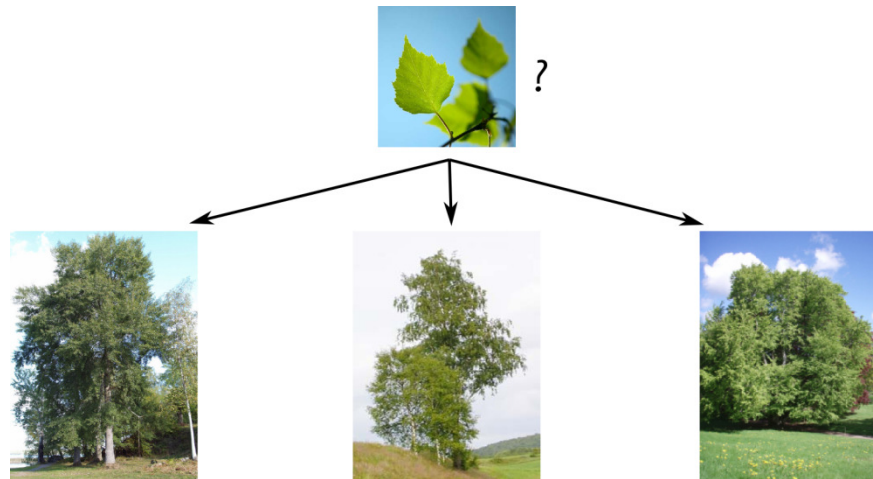

UPPSALA  
UNIVERSITET

SLU

# Descriptors

- We have now represented our objects in different ways (using boundary representation and skeletons)
- The next step is to **describe** our regions so that we later can **classify** them (next lecture)

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

# Simple boundary descriptors

## Boundary descriptors

- Length (perimeter)
- Diameter =  $\max_{i,j} [D(p_i, p_j)]$  = major axis
- Minor axis (perpendicular to major axis)
- Basic rectangle = major  $\times$  minor
- Eccentricity = major / minor
- Curvature = rate of change of slope

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

SLU

# Fourier descriptors

## Boundary descriptors

- Redefine the  $x$ - &  $y$ -coordinates of the boundary as the real and imaginary parts respectively of a complex number
- Fourier transform of the new coordinates generates the Fourier descriptors
- Inverse transformation will regenerate the original image
- Doing an inverse transform on a part of the descriptors will result in an approximation of the shape

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

SLU

# Fourier descriptors

- Represent the boundary as a sequence of coordinates
- Treat each coordinate pair as a complex number (2D 1D )

→

$$s(k) = [x(k), y(k)], k = 0, 1, 2, \dots, K - 1$$

$$s(k) = x(k) + iy(k)$$

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

# Fourier descriptors

- From the DFT of the complex number we get the Fourier descriptors (the complex coefficients,  $a(u)$ )

$$a(u) = \sum_{k=0}^{K-1} s(k) e^{-j2\pi uk/K}, u = 0, 1, 2, \dots, K - 1$$

- The IDFT from these coefficients restores  $s(k)$

$$s(k) = \frac{1}{K} \sum_{u=0}^{K-1} a(u) e^{j2\pi uk/K}, k = 0, 1, 2, \dots, K - 1$$

- We can create an approximate reconstruction of  $s(k)$  if we use only the first  $P$  Fourier coefficients

$$\hat{s}(k) = \frac{1}{P} \sum_{u=0}^{P-1} a(u) e^{j2\pi uk/K}, k = 0, 1, 2, \dots, K - 1$$

# Fourier descriptors

- Boundary reconstruction using 546, 110, 56, 28, 14 and 8 Fourier descriptors out of a possible 1090.

Swedish University of Agricultural Sciences  
Uppsala University

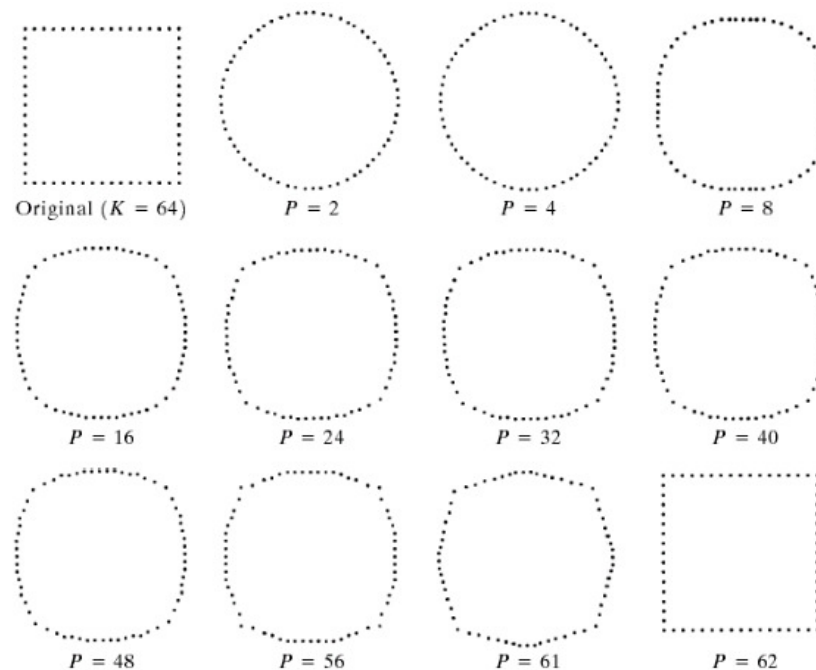

UPPSALA  
UNIVERSITET

SLU

# Statistical moments

## Boundary descriptors

- Useful for describing the shape of boundary segments (or other curves)
- Suitable for describing the shape of convex deficiencies
- The histogram of the function (segment curve) can also be used for calculating moments
  - 2<sup>nd</sup> moment gives spread around mean (variance)
  - 3<sup>rd</sup> moment gives symmetry around mean (skewness)

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

# Statistical Moments

- If  $v$  is a discrete random variable representing discrete amplitude in the range  $[0, A-1]$  then the  $n^{\text{th}}$  statistical moment of  $v$  (about its mean) is calculated as:

$$\mu(v) = \sum_{i=0}^{A-1} (v_i - m)^n p(v_i), \quad m = \sum_{i=0}^{A-1} v_i p(v_i)$$

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

# Simple Regional Descriptors

## Regional descriptors

- Area = number of pixels in a region
- Compactness (P2A) =  $\text{perimeter}^2 / \text{area}$
- Circularity ratio =  $4 \times \pi \times \text{area} / \text{perimeter}^2$
- Graylevel measures
  - Mean
  - Median
  - Max
  - Etc.

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

SLU

# Topological descriptors

## Regional descriptors

- Topology = The study of the properties of a figure that are unaffected by any deformation
- Topological descriptors
  - Number of holes in a region,  $H$
  - Number of connected components,  $C$
  - Euler number,  $E = C - H$

A B

# Topological descriptors

## Regional descriptors

- Using connected components

IR image

Thresholded image

Largest connected component

Skeleton

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

SLU

# Texture

## Regional descriptors

- Textures can be very valuable when describing objects
- Example below: Smooth, coarse and regular textures

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

SLU

# Texture

- Statistical texture descriptors:
  - Histogram based
  - Co-occurrence based(Statistical moments, Uniformity, entropy,... )
- Spectral texture descriptor
  - Use fourier transform

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

SLU

# Histogram based descriptors

## Regional descriptors

- Properties of the graylevel histogram, of an image or region, used when calculating statistical moments
  - $z$  : discrete random variable representing discrete graylevels in the range  $[0, L-1]$
  - $P(z_i)$  : normalized histogram component corresponding to the  $i^{\text{th}}$  value of  $z$

$$\mu_n(z) = \sum_{i=0}^{L-1} (z_i - m)^n p(z_i), \quad m = \sum_{i=0}^{L-1} z_i p(z_i)$$

2<sup>nd</sup> moment : Variance of  $z$

3<sup>rd</sup> moment : Skewness

4<sup>th</sup> moment : Relative flatness

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

# Histogram based descriptors

Uniformity and average entropy also uses  $z$  &  $P(z_i)$

- Uniformity (maximum for image with just one grayvalue):

$$U = \sum_{i=0}^{L-1} p^2(z_i)$$

- Average entropy (measure of variability. Is 0 for constant images)

$$e = - \sum_{i=0}^{L-1} p(z_i) \log_2 p(z_i)$$

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

SLU

# Co-occurrence matrix

## Regional descriptors

- For an image with  $N$  graylevels, and  $P$ , a positional operator, generate  $A$ , a  $N \times N$  matrix, where  $a_{i,j}$  is the number of times a pixel with graylevel value  $z_i$  is in relative position  $P$  to graylevel value  $z_j$
- Divide all elements in  $A$  with the sum of all elements in  $A$ . This gives a new matrix  $C$  where  $c_{i,j}$  is the probability that a pair of pixels fulfilling  $P$  has graylevel values  $z_i$  and  $z_j$  which is called the co-occurrence matrix

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

SLU

# Co-occurrence Matrix

$P =$  "one pixel down"

# Spectral Texture

## Regional descriptors

- Peaks in the Fourier spectrum give information about direction and spatial period patterns
- The spectrum can be described using polar coordinates  $S(r, \theta)$
- For each angle  $\theta$ ,  $S(r, \theta)$  is a 1D function  $S_\theta(r)$
- Similarly, for each frequency  $r$ ,  $S_r(\theta)$  is a 1D function
- A global description can be obtained by summing  $S_\theta(r)$  and  $S_r(\theta)$

$$S(r) = \sum_{\theta=0}^{\pi} S_\theta(r), \quad S(\theta) = \sum_{r=1}^R S_r(\theta)$$

# Moment Invariants

## Regional descriptors

- For a 2D continuous function  $f(x,y)$ , the moment of order  $(p + q)$  is defined as

$$m_{pq} = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} x^p y^q f(x, y) dx dy$$

for  $p, q = 0, 1, 2, \dots$

- The central moments are defined as

$$\mu_{pq} = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} (x - \bar{x})^p (y - \bar{y})^q f(x, y) dx dy$$

where

$$\bar{x} = \frac{m_{10}}{m_{00}} \quad \text{and} \quad \bar{y} = \frac{m_{01}}{m_{00}}$$

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

SLU

# Moment Invariants

- If  $f(x,y)$  is a digital image, the central moments become

$$\mu_{pq} = \sum_x \sum_y (x - \bar{x})^p (y - \bar{y})^q f(x, y)$$

- The normalized central moments, denoted  $\eta_{pq}$ , are defined as

$$\eta_{pq} = \frac{\mu_{pq}}{\mu_{00}^\gamma}$$

where  $\gamma = \frac{p+q}{2} + 1$  for  $p+q = 2, 3, \dots$

Centre for Image Analysis

Swedish University of Agricultural Sciences  
Uppsala University

UPPSALA  
UNIVERSITET

SLU

# Moment Invariants

- A set of seven invariant moments can be derived from the 2<sup>nd</sup> and 3<sup>rd</sup> moments
- These moments are invariant to changes in translation, rotation and scale

$$\phi_1 = \eta_{20} + \eta_{02}$$

$$\phi_2 = (\eta_{20} - \eta_{02})^2 + 4\eta_{11}^2$$

$$\phi_3 = (\eta_{30} - \eta_{12})^2 + (3\eta_{21} - \eta_{03})^2$$

$$\phi_4 = (\eta_{30} + \eta_{12})^2 + (\eta_{21} + \eta_{03})^2$$

... (see textbook)

# Principal components Analysis

- Calculate  $\mathbf{C}_x$ , covariance matrix of data  $\mathbf{X}$
- Find eigenvectors and corresponding eigen values of covariance matrix ( $\mathbf{C}_x \mathbf{e}_i = \lambda_i \mathbf{e}_i$ )
- Find  $\mathbf{A}$  which is a matrix with the eigenvectors as rows, ordered corresponding to decreasing eigenvalue
- Use  $\mathbf{A}$  to transform  $\mathbf{x}$  to  $\mathbf{y}$ :  $\mathbf{y} = \mathbf{A}(\mathbf{x} - \mathbf{m}_x)$ .
- Any vector  $\mathbf{x}$  can be recovered from  $\mathbf{y}$  by:  $\mathbf{x} = \mathbf{A}^T \mathbf{y} + \mathbf{m}_x$  and approximated by only using some (say  $k$ ) of the eigenvalues and an  $\mathbf{A}_k$  matrix constructed from the  $k$  eigenvectors

# Face recognition Using PCA

We need a training data set: bunch of sample images of people we want to recognize

Using PCA analysis we find eigenfaces (eigenvectors)

Every new image that we have, we project the Image on eigenvectors and based on the weights we obtained we can classify it.

$$\begin{array}{c} \text{Image of a woman's face} \end{array} = w_1 \begin{array}{c} \text{Eigenface 1} \end{array} + w_2 \begin{array}{c} \text{Eigenface 2} \end{array} + w_3 \begin{array}{c} \text{Eigenface 3} \end{array}$$
